Job description

About Redwood Materials

Redwood Materials was founded in 2017 by JB Straubel, co-founder and former CTO of Tesla, on a simple but radical idea: the critical minerals powering the energy transition already exist. They just need to come back. Today Redwood is the largest lithium-ion battery recycler in North America — recovering, refining, and redeploying critical minerals from end-of-life batteries back into the supply chain. On the energy side, Redwood has deployed the largest second-life battery project in the world, delivering power to AI data centers in months rather than years using proprietary energy architecture engineered entirely in-house. The company is profitable, the market it operates in is projected to grow 20 to 50 times over the next decade, and Redwood is the only company with the supply chain, the technology, and the operational scale to lead it.

Infrastructure Software Engineer, Energy Storage

The Infrastructure Engineer is responsible for designing, building, and maintaining the foundational platform infrastructure that enables our engineering team to develop and deploy Battery Energy Storage Systems reliably and at scale. This role serves as a force-multiplier across the organization, owning edge fleet management, server provisioning, and deployment automation while ensuring systems are secure, scalable, and performant. The position partners closely with cross-functional engineering teams to translate early deployment learnings into platform improvements and drive resolution of scalability, reliability, and security challenges. Success in this role requires deep technical expertise, a collaborative mindset, and the ability to thrive in an ambiguous, fast-paced, early-stage environment.

Responsibilities will include:

- Design and own the rollout of edge Kubernetes fleet management, automated server provisioning, and software update pipelines to support scalable and reliable system deployment.
- Evaluate server hardware and operating systems to help define the architecture of the organization's next-generation energy storage platform.
- Identify and resolve hard infrastructure problems, including scalability bottlenecks, reliability gaps, performance issues, and security vulnerabilities.

- Build and maintain tooling and services used to validate software systems at scale, including performance and reliability testing frameworks.
- Serve as a technical resource for the broader engineering team through pair programming, in-office working sessions, and hands-on project leadership.
- Translate learnings from early deployments and customer pilots into concrete, measurable improvements to platform infrastructure.
- Reinforce a team culture grounded in engineering excellence, curiosity, inclusivity, and a willingness to take action and learn from mistakes.

Desired Qualifications:

- 5+ years of relevant industry experience in infrastructure, platform, or site reliability engineering.
- Strong grasp of system design principles and real-world experience building available, reliable, scalable, and secure distributed systems.
- Experience designing, implementing, and maintaining secure network systems and infrastructure.
- Genuine interest in server hardware fundamentals and how software and hardware interact at the platform level.
- Ability to work comfortably with ambiguity, prototype solutions iteratively, and learn rapidly from early-stage work.
- Strong written and verbal communication skills, with the ability to explain complex systems clearly to both technical and non-technical audiences.
- Ability to manage multiple workstreams, shifting priorities, and competing deadlines in a fast-paced, early-stage environment.

In accordance with California pay transparency laws, the salary range for this position is listed below. Actual compensation may vary based on a variety of factors, including experience, education, and skills.

California Pay Range:

$180,000—$237,500 USD

The position is full-time. Compensation will be commensurate with experience.

We collect personal information (PI) from you in connection with your application for employment with Redwood Materials, including the following categories of PI: identifiers, personal records, professional or employment information, and inferences drawn from your PI. We collect your PI for our purposes, including performing services and operations related to your potential employment. If you have additional privacy-related questions, please contact us at privacy@redwoodmaterials.com.

Archive notes for ECS 1100

Retrieval note: New posting found in expansion round. Official posting includes an application form with applicant input fields. Major fit is an archive classification; eligibility follows the employer qualifications.

Degree / experience excerpt: 5+ years of relevant industry experience in infrastructure, platform, or site reliability engineering.

Key skills listed in the archive: Kubernetes; automation

Archive metadata — Accessed October 26, 2026 (America/Chicago).

Recruiting status: Active · PDF: Complete · Source: Official employer Greenhouse Employer / ATS identifier: 5737879004

Career stage: Mid-career

Major fit: Direct skills pathway: software development, computing and engineering; consult the exact degree and experience requirements. Energy-sector connection: Control, integration and infrastructure software for stationary energy storage.

Retrieval note: New posting found in expansion round. Official posting includes an application form with applicant input fields. Major fit is an archive classification; eligibility follows the employer qualifications.

Identity review: New posting: official employer title, location and identifier captured.. Source type: Official employer Greenhouse. Source identifier: 5737879004.
