Job description

At Caris, we understand that cancer is an ugly word-a word no one wants to hear, but one that connects us all. That's why we're not just transforming cancer care-we're changing lives.

We introduced precision medicine to the world and built an industry around the idea that every patient deserves answers as unique as their DNA. Backed by cutting-edge molecular science and AI, we ask ourselves every day: "What would I do if this patient were my mom?" That question drives everything we do.

But our mission doesn't stop with cancer. We're pushing the frontiers of medicine and leading a revolution in healthcare-driven by innovation, compassion, and purpose.

Join us in our mission to improve the human condition across multiple diseases. If you're passionate about meaningful work and want to be part of something bigger than yourself, Caris is where your impact begins.

Position Summary

Caris Life Sciences serves hundreds of thousands of molecular cases a year and continues to grow at double-digit rates. Its molecular, imaging, and clinical-outcomes data support software that helps ensure a cancer patient's report is right, complete, and on time.

The Associate Software Engineer - Clinical Software Products contributes to the design, implementation, testing, and support of clinical software applications under the guidance of experienced engineers. Assignments are sequenced to build production experience: live clinical systems, regulated delivery practice, and cross-functional product development.

The team's toolchain includes advanced AI coding assistants and agentic workflows across design, implementation, and test generation. Characterization tests and golden-master replay validation serve as the executable evidence that behavior holds. Onboarding is harness-first: early assignments build or extend characterization tests, so the engineer learns current behavior through repeatable validation.

Delivery runs on CI/CD, automated testing, application-level observability, and risk-based release governance aligned with current FDA Computer Software Assurance guidance. Representative technologies across the portfolio include Java,

TypeScript, browser-based application frameworks, server-side JavaScript, and selected enterprise Java components. Interviews cover the specific assignment and technology stack.

This individual-contributor role reports to an Engineering Manager or Senior Engineering Manager within Clinical Software Engineering. The engineer works with senior engineers to maintain clinical software applications subject to SOX financial controls and FDA regulatory requirements, and builds production-engineering skills while meeting the team's software, quality, and compliance standards.

Location: Irving, Texas (Dallas-Fort Worth), on-site/hybrid, minimum three days per week on campus; co-located with Caris's laboratory and clinical operations.

Job Responsibilities

Implement well-scoped features, bug fixes, and technical improvements under the guidance of experienced engineers.

Write well-structured, testable, documented code that holds up in a regulated production environment.

Ask clarifying questions in design discussions and carry the feedback into the work.

Submit changes for peer review, respond to the feedback, and review teammates' code at a level appropriate to experience. Work with product management and engineering teammates to pin down requirements, acceptance criteria, and technical constraints.

Build and maintain automated unit, integration, and end-to-end tests as part of feature delivery.

Turn recurring delivery tasks and repeated manual steps into scripted, reviewed automation with senior guidance.

Document work in design notes, operational runbooks, and knowledge-base articles.

Instrument and monitor production software with team guidance, and take part in incident reviews and root-cause analysis.

Learn SOX and FDA change-control practice by doing it: complete the required evidence and documentation for assigned work.

Pair with teammates, join technical learning sessions, and share findings across the team.

Work AI-first from day one: use AI coding assistants and agentic workflows under senior guidance across implementation and test work, with review as the quality gate.

Required Qualifications

Bachelor's degree in Computer Science, Software Engineering, or a related technical field, or equivalent practical experience.

0-2 years of professional software engineering experience; relevant internships, co-op programs, research, or substantial project work may count toward this range.

Foundational proficiency in at least one general-purpose programming language.

Familiarity with SDLC practices from professional, academic, internship, or project work.

Comfort with source control, automated testing, and collaborative code review.

Ability to communicate clearly, incorporate feedback, and learn unfamiliar systems and technologies.

Hands-on use of AI coding assistants in coursework, internships, projects, or professional work.

Preferred Qualifications

Internship, co-op, research, or project experience building and testing software in a team environment.

Familiarity with web applications, APIs, databases, or cloud-development concepts.

Experience writing unit, integration, or end-to-end tests.

Exposure to agile delivery practices and associated tooling.

Interest in healthcare, clinical laboratory, diagnostics, or life sciences software.

Strong analytical and problem-solving skills, with attention to detail.

Physical Demands

Ability to sit, stand, and work at a computer for extended periods.

Training

All job-specific, safety, and compliance training is assigned based on the job functions associated with this employee.

Other

This role may require periodic travel to other Caris sites or partner locations. After-hours support or participation in periodic scheduled on-call activities may be required as skills and experience develop, with guidance from experienced engineers.

Conditions of Employment: Individual must successfully complete pre-employment process, which includes criminal background check, drug screening, credit check (applicable for certain positions) and reference verification.

This job description reflects management’s assignment of essential functions. Nothing in this job description restricts management’s right to assign or reassign duties and responsibilities to this job at any time.

Caris Life Sciences is an equal opportunity employer. All qualified applicants will receive consideration for employment without regard to race, religion, color, national origin, gender, gender identity, sexual orientation, age, status as a protected veteran, among other things, or status as a qualified individual with disability.

Notes for ECS 1100 students

How this connects to your major

Computer Science: healthcare software, embedded systems, automation or secure computing. These are teaching annotations, not an employer guarantee of eligibility.

Use the degree and experience evidence to distinguish a first job from a later career step.

CS: Named discipline appears in source; consult qualifications for eligibility

Skills mentioned in the posting

Java, Git/source control, Cloud, Software testing, Verification/validation, Communication/teamwork

Eligibility excerpts not shown above

Compensation (source excerpts): Not stated in captured posting text.

Course sheet tags

Majors (teaching tags): CS; Career stage (teaching tag): Entry-level (0-2 years stated); Geography: DFW; Recruiting status at capture: Posting readable at capture; no closure notice found; Employment type: Full time.
